Under the Supervision of
Mr. Pathak P.A

Department of Computer Science and Engineering

ARVIND GAVALI COLLEGE OF ENGINEERING, SATARA 2023-24

CERTIFICAT

This is to certify that the Project report entitled “**Delivery Delights**” is a bonafide work carried out by:

Sr.No	Name of Student	PRN NO
1.	More Srushti Sanjay	23065451242509
2.	Patil Aishwarya Dnyandev	23065451242511
3.	Bhingardeve Sahil Vinayak	23065451242515
4.	Pawar Sanika Avinash	23065451242518

Under our supervision, during the year 2023-24 and submitted to the faculty of Computer Science and Engineering, AGCE Satara in partial fulfillment of the requirements for the award of the Degree of Bachelor of Technology in Computer Science and Engineering.

Acknowledgement

It is our privilege to acknowledge my deep sense of gratitude to my guide Mr. Pathak P.A. in Computer Science and Engineering at Arvind Gavali College of Engineering, Satara for his/her valuable suggestions and guidance throughout our course and the timely help given to us in completion of our project work.

We are thankful to Dr. V. A. Pharande, Principal, Arvind Gavali College of Engineering, Satara and Dr Bhosale V. K. Head of Computer Science and Engineering department for their kind co-operation & morale support.

Finally, we wish to express our sincere thanks to all the staff members of Arvind Gavali College of Engineering, Satara for their direct and indirect help during the course of our project.

ABSTRACT

Online food ordering system is mainly designed primarily function for use in the food delivery industry. This system will allow hotels and restaurants to increase online food ordering such type of business. The customers can be selected food menu items just few minutes. In the modern food industries allows to quickly and easily delivery on customer place. Restaurant employees then use these orders through an easy to delivery on customer place easy find out navigate graphical interface for efficient processing.

Also Online Food Ordering System is proposed here which simplifies the food ordering process. The proposed system shows an user interface and update the menu with all available options so that it eases the customer work. Customer can choose more than one item to make an order and can view order details before logging off. The order confirmation is sent to the customer. The order is placed in the queue and updated in the database and returned in real time. That enables ease for the customers. It overcomes the disadvantages of the traditional queueing system. Our proposed system is a medium to order online food hassle free from restaurants as well as mess service. This system improves the method of taking the order from customer. The online food ordering system sets up a food menu online and customers can easily place the order as per their wish. Also with a food menu, customers can easily track the orders.

Chapter 1

INTRODUCTION

Chapter 1

INTRODUCTION

1.1 General Introduction

The online food ordering system sets up a food menu online and customers can easily place the order as per they like. Also with a food menu, online customers can easily track the orders. The management maintains customers database, and improve food delivery service. The Restaurant management systems motivates us to develop the system. There are various facilities provided so that the users of the system will get service effectively. Also, the system considers Restaurants as well as Mess facility to the customers. Again, the idea comes that mostly mess users are person who are shifted for various reason in new cities. So, they are interrelated.

Increasing use of smart phones is also considered as a motivation, so that any users of this system get all service on single click. Another motivation can be considered as the system will be designed to avoid users doing fatal errors, users can change their own profile, users can track their food items through GPS, users can provide feedback and recommendations and can give ratings, it will give appropriate feedbacks to Restaurants / Mess service providers. Due to lack of a full fledged application that can fulfill the customer requirements by providing him food from restaurants as well as from mess service, there is a need for the system.

This proposed system will be used by the people who keep shifting from cities to cities. As well as, it will be useful for the students studying in different cities. The proposed system will provide the flexibility to the Customers/Users to order from either Restaurants or Mess. It will also provide Recommendations to the customers from the restaurants/mess owners uploaded on a daily basis. In the proposed system, there will be no limitation on the amount of order the customer wants. Also, same application can be used as a Startup Business for the developers. It will provide real time customers feedback and ratings along with the comments to the restaurants/mess owner. It gives appropriate feedback's to users, so if there is any error happened, then there will be a feedback dialog toward users.

1.2 Problem Statement

The online food ordering system sets up a food menu online and customers can easily place the order as per they like. Also, the online customers can easily track their orders. The management maintains customer's database, and improve food delivery service. This system also provides a feedback system in which user

can rate the food items. Also, the proposed system can recommend hotels, food, based on the ratings given by the user, the hotel staff will be informed for the improvements along with the quality. The payment can be made online or cash or pay-on-delivery system. For more secured ordering separate accounts are maintained for each user by providing them an ID and a password.

1.3 Objective of Present work

- ✓ To evaluate the way of customers.
- ✓ To develop a restaurant ordering system With mobile application based on the client server application.
- ✓ To determine the factors that influence customer when ordering food online.
- ✓ To computerized the food ordering system process and display details of sales history.

LITERATURE REVIEW

Chapter 2

LITERATURE REVIEW

[1] Online Food Ordering System :-

Authors: Yash Rane, Shubham Patil , Santosh Salunkhe, Prof. S. P. Kakade

conclusion of the proposed system is based on user's need and is user cantered. The system is developed in considering all issues related to all user which are included in this system. Wide range of people can use this if they know how to operate android smart phone

[2] Online Food Ordering System :-

Authors : Abhishek Singh¹, Adithya R², Vaishnav Kanade³, Prof. Salma Pathan⁴

Customer using a Smartphone is considered as a basic assumption for the system. When the customer approach to the restaurant, the saved order can be confirmed by touching the Smartphone. The list of selected preordered items shall be shown on the kitchen screen, and when confirmed, order slip shall be printed for further order processing. The solution provides easy and convenient way to select pre-order transaction form customers.

[3] The Online Food Ordering System :-

Authors : Kondra Revathi Satya a , Ch Tejab , Ashish Shrivastavaa

In this paper it has been planned that the way to improve the management of food delivery services and pay attention to customers' databases and it is developed from the edifice management system to induce the services with efficiency from the users of the system, providing numerous facilities. Restaurants yet as a multitude facility square measure enclosed during this.

[4] A Study Of Consumer Behaviour Towards Food Ordering And Delivery Platform:-

Authors : Sayali Pachpute

The research helps find various strategies used by major food delivery companies to promote their business in India and the effect caused by online food delivery apps on restaurant business. According to the study, food ordering through apps is growing but still many new start-ups failed to survive in the competition and faced closure.

[5] An empirical study of online food delivery services from applications perspective

Authors : Sundramurthy Venkatesa Prabhu

The food industry, like many others, has also gained from the e-commerce boom. That is, by making food accessible on online channels, the growing number of food distribution apps and web-sites has transformed the landscape of the food industry. Basically, it's called online food ordering to order food through a web page or mobile application. During the last few years, online food ordering has grown steadily.

HARDWARE IMPLEMENTATION

Chapter 3

HARDWARE IMPLEMENTATION

3.1 Hardware Used

1. Server

1 GB RAM

80 GB Hard Disk

1.6 GHz Processor

Chapter 4

SOFTWARE IMPLEMENTATION

Fig.1: System Architecture

Fig 4.1 System Architecture

The architectural design consists of 3 main users: -

- ◆ Service Consumer
- ◆ Owner of Restaurant
- ◆ Employee of Restaurant

When a person shifted to new city he has to ? and source for hygienic and quality food, so he/she will search and select mess or home-based food service based on his category and as well as service that is veg or non-veg.

Here the main function is, in what pattern user will search the service so for that purpose a part of Geo-Hashing Algorithm is used, and GPS system should be on Person can have the facility to search service by location that is home location of the person is detected with GPS and according to selected option location of nearby service get searched. Another way for searching is by cost. Here user must give input in terms of rupees that in what range he/she need service per plate if there are any service provider within that area then the list will display.

Fig .4.2 Flowchart

User can also search by rating. The service that has rating is checked by user given rating and if matched it will give the list of service. Search can be done by accepting distance from user in which user need to search and displaying service provider within that distance. User can communicate to service provider with the help of message box and get notification from provider end if any. On the other end provider has facility to add or reject request from person who want to join the service.

Fig. 4.3 DFD 0

DFD is the Data Flow diagram (Level 0) is a way of representing a flow of a data of a process or a system. The DFD also provides information about the outputs and inputs of each entity and the process itself. Our system represents the flow of process. In this system our data flow is similar to the actual flow of the website that's why our DFD and Flowchart are the same.

Fig 4.4 Use Case Diagram

A use case diagram is a representation of a user's interaction with the system and shows the relationship between the user and the different use cases. In above fig. our system represents the interaction between user and system.

Fig 4.5 Activity Diagram

Activity diagram focuses on the execution and flow of the behavior of a system instead of implementation. Above fig represents the actual flow of and behavior of our system. It consist of that are made up of action which apply to behavioral modeling technology.

Fig 4.6 Component Diagram

This component diagram shows the all different component present in website as above

Chapter 5

RESULTS AND CONCLUSION

5.1 RESULT

1) Main Page- This is output of project. Website can successfully identifies the different restaurants according to the customer or user criteria's such as restaurant names. Once a user make their profile on our website its shows the accurate details to they can approach for place order again.

2) Admin Page -This page is available only for admin admin login here by using username & password

3) Dashboard Page -This Is Dashboard page it will display when admin login, here admin check all the details of customer page.

Fig 5.2: Admin Page

Fig 5.3: Dashboard Page

5.2 CONCLUSION

An online food ordering system has been planned wherever the purchasers will create associate or orders the food and avoid the hassles of watching for the order to be taken by the waiter. The exploitation of the application, the tip users register online, scan the E-menu card, and choose the food from the e-menu card to order food online. Once the client selects the desired food item the cook is going to be ready to see the results on the screen and begin to process the food. This application nullifies the requirement of a waiter or reduces the employment of the waiter. The advantage is that in a very jammed eating place there will be the probability that the waiters are overladen with orders and that they are unable to fulfil the wants of the client in a very satisfactory manner.

5.3 FUTURE SCOPE

In next version we will be launching this application in regional languages such as Hindi , Marathi , Gujrati , Tamil.

Also if possible we would try to make this application more user-friendly so that more and more people will be able to take benefit of it.

Use Example:

- 1) Government
- 2) Colleges
- 3) Cities
- 4) Home
